DEPARTMENT OF ENVIRONMENTAL QUALITY AIR QUALITY DIVISION

ACTIVITY REPORT: On-site Inspection

P001159265

FACILITY: Speedway SuperAmerica, L	SRN / ID: P0011		
LOCATION: 3029 E. Kalamazoo St., LANSING		DISTRICT: Lansing	
CITY: LANSING	CITY: LANSING		
CONTACT: Michael Cox , Project Manager		ACTIVITY DATE: 08/11/2021	
STAFF: Michelle Luplow	SOURCE CLASS: MINOR		
SUBJECT: Announced, onsite, scheduled inspection to determine compliance with PTI 116-15			
RESOLVED COMPLAINTS:			

Inspected by: Michelle Luplow

Speedway Site Contacts:

Mike Cox, Atlas ATC Project Manager (michael.cox@oneatlas.com)

Dylan Schuberg, Atlas ATC Field Scientist (Dylan.schuberg@oneatlas.com)

Sean Ericksen, Marathon Petroleum (seericksen@marathonpetroleum.com)

Purpose

Conduct an announced, onsite, scheduled compliance inspection of Admiral Petroleum's Air Sparge/Soil Vapor Extraction (SVE) remediation system (with catalytic oxidation control), located at an operational gas station (Admiral store #7207), to determine compliance with General PTI No. 116-15. Records indicate this is the first time this site has been inspected. This source is currently owned and operated by Marathon Petroleum.

Facility Background/Regulatory Discussion

Remediation activities at this site began in December 2016 and operated through June 13, 2019, at which point, operations have since been put on hold. Michael Cox, Project Manager, said that there are no immediate plans to restart the remediation system. They are currently in negotiations with a third party to complete additional site investigations and corrective actions, and based on those investigations, a decision will be made regarding whether the system should be restarted. One Atlas wishes to keep the permit active until RRD closes the LUST release at the facility.

According to the last report that RRD received (provided by RRD staff, Autumn Henney, attached), the system last operated between January 1, 2019 and June 13, 2019. On June 13, 2019, the Lansing Fire Department suspected a tank overflow, and it was determined that a cap had come off of a monitoring well and the water was being pushed to the ground surface from the active air sparge system. The remediation system was immediately shut down and has remained shut down since June 13, 2019.

Inspection

On August 11, 2021 I met with Dylan Schuberg at approximately 9:00 a.m. at the remediation site. The equipment was not operating during the inspection.

FG-REMEDIATION

FG-REMEDIATION consists of air sparge and soil vapor extraction system with catalytic oxidation control. This General Permit covers sources with total potential VOC or gasoline emissions greater than 10 tons per year and/or total potential BTEX emissions greater than 1 ton per year.

Air is injected into the ground and the soil vapor extraction system pulls the air out of the ground, along with any VOCs/BTEX. This gas stream is then sent to the catalytic oxidizer for control.

There are no Material Limits, Design/Equipment Parameters, Testing/Sampling, or Reporting requirements at this time.

Emission Limits & Monitoring/Recordkeeping

This site is limited to 10.0 tpy each of total VOC and total gasoline, and 1.0 tpy total BTEX on a 12-month rolling basis. For soil remediation, the permittee is required to monitor and record the gas flow rate and the VOC, gasoline and/or BTEX concentrations at the outlet of the soil vapor extraction system using Appendix R-2 of the General PTI. Quarterly monitoring of these parameters is required and monthly and annual records of the total VOC, gasoline or BTEX emissions are required to be kept.

I requested records for the previous 5 years (August 2016 – July 2021). Because the system was not operating after June 13, 2019, records provided covered the period from August 2016 through June 2019. Inlet concentration (pre-control), gas flow rate, lb/hr and ton/month and ton/12-month rolling were provided for total VOCs and total BTEX (see attached). Per the permit application, 98% control efficiency is applied to all calculations. Total VOC during all 12-month rolling periods covered from August 2016 – June 2019 was less than 2 tons per 12-month rolling period. Total BTEX during all 12-month rolling periods covered from August 2016 – June 2019 was less than 1 ton per 12-month rolling period.

M. Cox has been informed that records should be kept in a format similar to Appendix R-2 of the General Permit to Install if they decide to start up the system again.

Process/Operational Restrictions & Monitoring/Recordkeeping

The permittee is required to install maintain and operate the catalytic oxidizer according to the manufacturer's specifications. Proper operation also requires a minimum of 98% reduction of hydrocarbon emissions to the atmosphere and operating the oxidizer at a minimum of 600F at the inlet to the catalyst bed and a maximum space velocity of 40,000/hr. A temperature indication device which continuously displays the operating temperature of the inlet to the catalyst bed of the oxidizer is required to be installed and maintained in accordance with the manufacturer's specifications.

Although not operating, I verified that the catalytic oxidizer has a digital temperature monitoring device. "T1" is used to determine the inlet temperature into the catalytic bed. A snapshot review of the operation and maintenance records in 2019 indicate that the temperature of the inlet to the catalyst bed, T1, was greater than 600F (specifically 330C). M. Cox said that the catalyst did not need to be replaced during the years it operated, and that there were no malfunctions of the control device.

M. Cox has been informed that maintenance records should be made clearer in terms of following manufacturer's recommendations to maintain the catalytic bed, in the event that they determine the system will be operated in the future.

Stack/Vent Restrictions

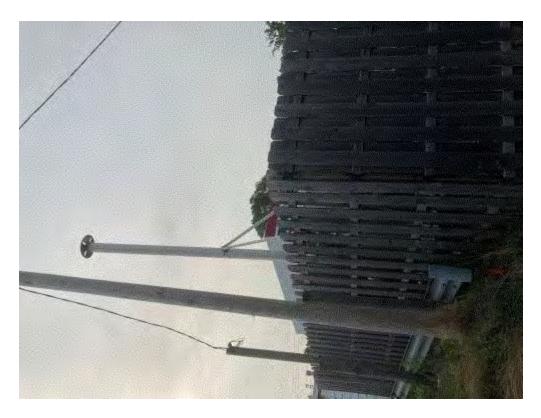

Exhaust gases are required to be discharged unobstructed vertically upwards to the ambient air at an exit point at least 1.5 times the building height, but not less than 20' above ground level. During the inspection I verified that the stack is greater than 20' from ground level, and appears to be 1.5 times the height of the remediation equipment trailer. I did note, however, that a raincap was on the stack. Mike Cox has been informed that the raincap must be removed if the remediation system is started up again to ensure compliance with the requirement that the stack discharge is unobstructed.

Compliance Statement

At this time it appears that Marathon is in compliance with General PTI 116-15.

Image 1(Catalytic Oxidizer): Control device for remediation.

<u>Image 2(Exhaust Stack)</u>: Stack is appropriate height relative to the remediation trailer. Note that stack is obstructed with a raincap.

Image 3(Temp Monitor): Note "T1" is monitor for inlet temperature to catalytic bed.

LEAKING UNDERGROUND STORAGE TANK SUPPLEMENTAL INFORMATION COVER SHEET

INSTRUCTIONS: Use this form to submit all supporting documentation requested by the RRD or to voluntarily submit additional information. NOTE: Submittal of a Final Assessment Report (FAR) or Closure Report, revised as a result of a DEQ audit, requires use of the FAR or Closure Report cover sheet Form EQP4000 or EQP4452 indicating it is "revised per DEQ audit". Use Form EQP4005 or EQP4004 to submit documentation to demonstrate that conditions identified in an "approval with conditions" audit determination are satisfied. The RRD may comment on supplemental information but only has the authority to audit FARs and Closure Reports. Please submit the completed form and supplemental information to the appropriate RRD District Office.

ANNUAL 2019 STATUS REPORT

Former Speedway LLC #7207

3029 East Kalamazoo Street Lansing, Michigan 48912-4614 Ingham County

Facility ID: 00009647 Confirmed Release No. C-0999-95

April 9, 2020

Prepared for:

Speedway LLC P.O. Box 1500 Springfield, Ohio 45501-1500

Prepared by:

ATC Group Services LLC 2650 Horizon Drive SE, Suite 110

Grand Rapids, Michigan 49546-7685

1.0 INTRODUCTION AND ACTIVITIES COMPLETED

Speedway LLC (Speedway) has retained ATC Group Services LLC (ATC) to provide environmental services for Former Speedway #7207 (the site) in accordance with Part 213 of Michigan's Natural Resources and Environmental Protection Act (NREPA), 1994 Public Act (P.A.) 451, as amended (Part 213). The site is an operating petroleum retailer and convenience store currently owned by GPM Investments, LLC, and formerly owned by Speedway, and located at 3029 East Kalamazoo Street, Ingham County, Lansing, Michigan. The site general location and layout are presented on **Figures 1 and 2A, Appendix A**, respectively.

The purpose of this report is to document the following activities conducted at the site: (1) groundwater gauging and sampling activities conducted at the site on March 7 and 8, 2019, June 26 and 27, 2019, September 3 and 4, 2019; and December 5, 2019; and (2) remedial activities associated with the operation of a soil vapor extraction (SVE) and air sparge (A/S) system utilizing a catalytic oxidizer (catox) at the site between January 1, 2019 and June 13, 2019.

2.0 PROJECT DISCUSSION AND SAMPLING METHODOLOGY

2.1 Groundwater Monitoring

On March 7, 2019; June 26, 2019; September 3, 2019; and December 5, 2019; the depth to groundwater in select monitoring wells was measured using either a standard water-level tape that operates through an electrical sensor or an oil/water interface probe. At each monitoring well location, the manhole cover and the well cap were removed, and the well cap was cleaned. After the groundwater level in the well equilibrated with atmospheric pressure, the depth to groundwater was measured. Before use in each well, the water-level tape, and the oil/water interface probe, were decontaminated with a non-phosphate detergent and rinsed with tap water.

2.2 Groundwater Sampling

On March 7 and 8, 2019, groundwater samples were collected from the following twenty (20) monitoring, observation, and recovery wells: MW-02, MW-03, MW-06, MW-08R, MW-09D, MW-17, MW-20, MW-22 through MW-26, MW-31, MW-34, MW-37, MW-39, MW-40, OW-B, OW-F, and RW-36. The following monitoring and observation wells were gauged but not sampled: MW-01, MW-04, MW-05, MW-07, MW-11, MW-14D, MW-16D, MW-18, MW-19, MW-21, MW-29, MW-30, MW-33, MW-35, MW-38, OW-B (2014), and OW-E. Observation well OW-D was not gauged or sampled. Monitoring well MW-32 was located beneath a dumpster, monitoring well MW-27 was obstructed with ice, and monitoring well MW-28 was located beneath the remediation trailer; therefore, samples were not collected from these locations. Observation well OW-A was under the influence of the air sparge system; therefore, it was not gauged or sampled.

On June 26 and 27, 2019, groundwater samples were collected from the following twenty (20) monitoring, observation, and recovery wells: MW-02, MW-06, MW-08R, MW-09D, MW-17, MW-20, MW-22 through MW-26, MW-31, MW-32, MW-34, MW-37, MW-39, MW-40, OW-B, OW-F, and RW-36. The following monitoring and observation wells were gauged but not sampled: MW-01, MW-03, MW-04, MW-05, MW-07, MW-11, MW-14D, MW-16D, MW-18, MW-19, MW-21, MW-27, MW-29, MW-30, MW-33, MW-35, OW-A, and OW-B (2014). Observation well OW-D was not gauged or sampled. Monitoring well MW-28 was located beneath the remediation trailer and wells MW-38 and OW-E were located beneath a dumpster; therefore, samples were not collected from these locations.

On September 3 and 4, 2019, groundwater samples were collected from the following twenty-one (21) monitoring, observation, and recovery wells: MW-02, MW-03, MW-06, MW-08R, MW-09D, MW-17, MW-20 through MW-26, MW-31, MW-34, MW-37, MW-39, MW-40, OW-B, OW-F, and RW-36. The following monitoring and observation wells were gauged but not sampled: MW-01, MW-04, MW-05, MW-07, MW-11, MW-14D, MW-16D, MW-18, MW-19, MW-27, MW-29, MW-30, MW-32, MW-33, MW-35, OW-A, and OW-B (2014). Observation well OW-D was not gauged or sampled. Monitoring well MW-28 was located beneath the remediation trailer and wells MW-38 and OW-E were located beneath a dumpster; therefore, samples were not collected from these locations.

On December 5, 2019, groundwater samples were collected from the following nineteen (19) monitoring and observation wells: MW-02, MW-03, MW-06, MW-08R, MW-09D, MW-17, MW-20 through MW-24, MW-26, MW-31, MW-34, MW-37, MW-39, MW-40, OW-B, and OW-F. The following monitoring and observation wells were gauged but not sampled: MW-04, MW-05, MW-07, MW-11, MW-14D, MW-16D, MW-18, MW-19, MW-27, MW-29, MW-30, MW-32, MW-33, MW-35, and OW-A. The following monitoring and observation wells were not gauged or sampled: MW-01, MW-25, OW-B (2014), and OW-D. Monitoring well MW-28 was located beneath the remediation trailer and wells MW-38 and OW-E were located beneath a dumpster; therefore, samples were not collected from these locations. Recovery well RW-36 was obstructed at 4.35 feet below top of casing (btoc); therefore, a sample was not collected from this location.

The locations of the monitoring, observation, and recovery wells are presented on **Figure 2A**, **Appendix A**.

During each sampling event, the groundwater samples were collected using one dedicated, disposable bailer per monitoring well in accordance with the Part 213 amendments, effective May 1, 2012. At each monitoring well, groundwater sample collection proceeded once three to five casing volumes of groundwater were purged using the disposable bailer.

The groundwater samples were collected into laboratory-provided sample containers, placed into a cooler containing ice, and logged onto a project-specific chain-of-custody form. The groundwater samples were shipped to Pace Analytical Services, LLC (Pace) located in Green Bay, Wisconsin, and analyzed for the presence of the Michigan Department of Environment, Great Lakes, and Energy (EGLE) unleaded gasoline Chemicals of Concern (CoCs): benzene, toluene, ethylbenzene, and total xylenes (BTEX), methyl-tert-butyl ether (MTBE), 1,2,4-trimethylbenzene (1,2,4-TMB), 1,3,5-trimethylbenzene (1,3,5-TMB), naphthalene, and 2-methylnaphthalene in accordance with United States Environmental Protection Agency (U.S. EPA) SW-846 Test Method 8260.

Groundwater that was purged during the March 7 and 8, 2019, sampling event was placed into one Michigan Department of Transportation (MDOT)-approved, 55-gallon steel drum and staged on-site pending pick-up and proper disposal. The drum was removed from the site on March 16, 2019.

Groundwater that was purged during the June 26 and 27, 2019, sampling event was placed into one MDOT-approved, 55-gallon steel drum and staged on-site pending pick-up and proper disposal. The drum was removed from the site on July 17, 2019.

Groundwater that was purged during the September 3 and 4, 2019, sampling event was placed into one MDOT-approved, 55-gallon steel drum and staged on-site pending pick-up and proper disposal. The drum was removed from the site on September 26, 2019.

Groundwater that was purged during the December 5, 2019, sampling event was placed into one MDOT-approved, 55-gallon steel drum and staged on-site pending pick-up and proper disposal. The drum was removed from the site on December 17, 2019.

The associated waste disposal manifests for the March, June, September, and December 2019, sampling events, are presented in **Appendix D**.

2.3 Quality Assurance and Quality Control

As part of the Quality Assurance and Quality Control (QA/QC) process, field blank and duplicate sample were collected during the groundwater sampling events and included with the samples submitted to Pace. On March 7 and 8, 2019, duplicate sample DUP1 was collected from monitoring well MW-23 and duplicate sample DUP2 was collected from MW-22. On June 26 and 27, 2019, duplicate sample DUP1 was collected from monitoring well MW-24 and duplicate sample DUP2 was collected from MW-39. On September 3 and 4, 2019, duplicate sample DUP1 was collected from monitoring well MW-37 and duplicate sample DUP2 was collected from MW-24. On December 5, 2019, duplicate sample DUPA was collected from monitoring well MW-09D and duplicate sample DUPB was collected from MW-39.

In addition, during each sampling event, a laboratory-provided trip blank was shipped to and from the site in a sample bottle cooler and submitted with the groundwater samples for analysis. The field blank, duplicate, and trip blank samples were analyzed for the presence of the EGLE unleaded gasoline CoCs: BTEX, MTBE, 1,2,4-TMB, 1,3,5-TMB, naphthalene, and 2-methylnaphthalene in accordance with U.S. EPA SW-846 Test Method 8260.

2.4 Air Sparge/Soil Vapor Extraction Remediation System

Installation of a soil vapor extraction (SVE) and air sparge (AS) system commenced in November 2014. Start-up and optimization of the SVE portion of the system occurred on December 27, 2016, and was conducted for the AS portion of the system on September 13, 2017. Details regarding the construction and operation of this remediation system can be found in a report titled, *Leaking Underground Storage Tank, Final Assessment Report*, dated May 14, 2015.

During this reporting period, the SVE/AS remediation system operated between January 1, 2019, and June 13, 2019. On June 13, 2019, ATC received a phone call from the Lansing Fire Department in regards to a suspected tank overflow. After discussions with the fire department, it was determined that the actual situation was that a cap had come off of a monitoring well, and water was being pushed to the ground surface from the active AS system. On that date, the remediation system was immediately shutdown via remote connection. The remediation system has remained shutdown since that time; there are no plans to restart the system.

In general, a system piping and trenching layout that shows the locations of AS and SVE well locations is provided as **Figure 2B**, **Appendix A**, and an instrumentation diagram depicting primary equipment within the Mobile Treatment Unit (MTU) is provided as **Figure 2C**, **Appendix A**.

The AS side of the remediation system injects air into the aquifer that becomes process vapor as it contacts petroleum-impacted media during vertical migration. The vapor is routed (passively) through a narrow clay layer via low permeability borings, referred to as Short Circuit Borings, that were installed to perforate the clay around the perimeter of the AS injection area. SVE wells then recover the process vapor for treatment and/or permitted air discharge. The Short Circuit Borings are shown on **Figure 2B**, **Appendix A**. Also shown on this figure are estimated radius of influence (ROI) circles surrounding each AS and SVE well.

Recovered vapor undergoes water separation through a knock-out tank as water that is sometimes entrained in the recovery piping and/or water vapor (based on relative humidity) condenses as the temperature of the process air drops. The vapor is heated to a temperature greater than 600 degrees Celsius in a catalytic oxidizer to destroy the volatile organic compounds (VOCs) present prior to being emitted. A catalytic oxidizer uses a rare metal surface area to burn/oxidize excess petroleum vapors in the same manner an automobile exhaust does; however, there is no engine in an oxidizer so an air heater heats up the air stream, and is configured to recycle heat when there are petroleum vapors burning on the metal surfaces.

The mass influent calculations, operation, maintenance, and monitoring information collected from the 2019 site visits, 2019 air effluent emissions tracking, and 2019 12-Month Rolling table required by the air permit, are provided in **Tables 2A, 2B, and 2C, Appendix B**, respectively. Laboratory reports for the process air samples collected and identified as "PRE-CATALYST" and "CATOX EFFLUENT" (as indicated in **Tables 2A and 2B**) are provided in **Appendix C**.

Chart 1 and Chart 2 are included as **Tables 2D and 2E, Appendix B**, to depict mass recovered and operational run times from when the system started (December 27, 2016) to when the system was shutdown (June 13, 2019). From January 1, 2019, through June 13, 2019, the system recovered approximately 1,476 pounds of petroleum hydrocarbons (approximately 253 gallons).

Existing Permits

The following permits have been issued for the remediation system. A "Joint Permit" permitted the installation of the equipment within the floodplain in accordance with Army Corps of Engineers and State of Michigan regulations; this permit expired shortly after the site flooding occurred. There are existing charges associated with the permit on the MiWaters system. The charges are not valid and have been present since surface and groundwater discharge permitting activities were required on the MiWaters system in 2015; however, the MiWaters software code contained errors and programming bugs that did not allow the items to be cancelled/corrected at the time the permit was issued. Administratively, the permit should officially be deactivated and the charges removed.

An air permit was obtained for an initial system design in 2012. Upon notification of modification of the system design, a new permit was issued in 2015. Since the 2012 system was never installed, it has been technically "void" after 18 months without installation or operation. The permit requires administrative removal.

Lansing Township required a permanent building permit for the trailer because its anticipated duration was greater than six months. No other activities are required for construction or decommissioning.

Lansing Board of Water and Light approved the installation of the remediation system. The system was also certified through Chemviron Midwest, Inc. of Wooster, Ohio, by a Nationally Recognized Third Party Testing Laboratory (similar to a UL listing) prior to installation.

A listing of the active and expired permits for the AS/SVE remediation system is listed below. Copies of the Generic Remediation System Air Permit Requirements and the Lansing Township Building Permit are provided in **Appendix E**.

Permit	Status	Date
Joint Permit Floodplain Only (Part 31) 12-33-0063-P v3.0	Expired	04/13/2018
Air General Permit To Install – Remediation	Active	06/13/2012

Lansing Township Building Permit	Approved	2017
Electrical Permit/Inspection	Approved	2017
Groundwater Discharge Permit (Reinjected On-site/Up-gradient)	Exempt	

3.0 PRESENTATION AND ANALYSIS OF RESULTS

3.1 Groundwater Monitoring Results

There are two groundwater bearing zones being monitored at this site, the deep zone and the shallow zone. Active monitoring wells screened in the shallow zone include: MW-01 through MW-07, MW-08R, MW-11, MW-17 through MW-26, MW-28, MW-30, MW-31, MW-32, MW-34, MW-35, MW-37 through MW-40, recovery well RW-36, air sparge well ASW, and observation wells OW-A through OW-F. Active monitoring wells screened in the deep zone include: MW-9D, MW-14D, MW-16D, MW-27, MW-29, and MW-33.

The static groundwater elevation data for the March 7, 2019; June 26, 2019; September 3, 2019; and December 5, 2019; groundwater gauging events in the shallow and deep groundwater bearing zones are presented on **Figures 3A through 3H, Appendix A**, and summarized in **Tables 1A and 1B, Appendix B**.

On March 7, 2019, the depth to groundwater ranged from 5.41 feet btoc at monitoring well MW-30, to 8.20 feet btoc at monitoring well MW-14D. The average depth to groundwater on March 7, 2019 was 6.30 feet btoc, and the apparent direction of groundwater flow in the shallow zone was generally to the southwest. The apparent direction of groundwater flow in the deep zone was generally to the southeast.

On June 26, 2019, the depth to groundwater ranged from 3.28 feet btoc at monitoring well MW-09D, to 6.32 feet btoc at monitoring well MW-14D. The average depth to groundwater on June 26, 2019 was 4.50 feet btoc, and the apparent direction of groundwater flow in the shallow zone was generally to the southwest. The apparent direction of groundwater flow in the deep zone was generally to the south.

On September 3, 2019, the depth to groundwater ranged from 6.49 feet btoc at monitoring well MW-30, to 9.51 feet btoc at monitoring well MW-14D. The average depth to groundwater on September 3, 2019 was 7.45 feet btoc, and the apparent direction of groundwater flow in the shallow zone was generally to the southeast. The apparent direction of groundwater flow in the deep zone was generally to the southeast.

On December 5, 2019, the depth to groundwater ranged from 4.75 feet btoc at monitoring well MW-17, to 18.05 feet btoc at monitoring well MW-20. The average depth to groundwater on December 5, 2019 was 6.27 feet btoc, and the apparent direction of groundwater flow in the shallow zone was generally to the south. The apparent direction of groundwater flow in the deep zone was generally to the north.

On these dates, select site monitoring wells were checked for the presence of mobile light non-aqueous phase liquid (LNAPL). Mobile LNAPL was not present in any of the site wells during these checks.

3.2 Groundwater Sampling Results

The laboratory analytical data from the March 7 and 8, 2019; June 26 and 27, 2019; September 3 and 4, 2019; and December 5, 2019; groundwater sampling events is presented on **Figures 4A through 4D**, **Appendix A**. Groundwater sample analytical results for the on-site and off-site monitoring wells are presented in **Tables 1A and 1B**, **Appendix B**. The laboratory-provided groundwater analytical reports are presented in **Appendix C**.

On September 4, 2018, the EGLE issued site-specific Volatilization to Indoor Air Criteria (VIAC). These criteria have been used for data evaluation in this report.

A Restrictive Covenant filed for the site on February 12, 2001, states that the property use must remain consistent with the EGLE nonresidential land use category and the installation of any wells and the use of groundwater for any purpose, except for environmental groundwater monitoring and remediation purposes are prohibited. Therefore, Residential Drinking Water Criteria are not applicable for comparison to the analytical results of groundwater samples collected from on-site monitoring wells.

The on-site groundwater analytical data presented in **Table 1A, Appendix B**, is compared to the following EGLE cleanup criteria provided in P.A. 451 (EGLE Operational Memorandum 1, Attachment 1 - Table 1, effective date January 10, 2018, updated June 25, 2018):

- 1) Groundwater Surface Water Interface Criteria (GSI)
- 2) Nonresidential Volatilization to Indoor Air Criteria (VIAC) Groundwater Not In Contact (GWNIC)

Because the Restrictive Covenant does not apply to off-site properties and right-of-ways, the off-site groundwater analytical data presented in **Table 1B**, **Appendix B**, is compared to the following EGLE cleanup criteria provided in P.A. 451 (EGLE Operational Memorandum 1, Attachment 1 - Table 1, effective date January 10, 2018, updated June 25, 2018):

- 1) Residential Drinking Water Criteria
- 2) GSI criteria
- 3) Residential VIAC Groundwater In Contact (GWIC)

Based on the laboratory analytical results from the March 7 and 8, 2019, groundwater sampling event, EGLE unleaded gasoline CoCs were detected at concentrations reported above the applicable cleanup criteria in the groundwater samples collected from monitoring, recovery, and observation wells MW-20, MW-22, MW-23, MW-24, MW-31, MW-39, RW-36, and OW-F. EGLE unleaded gasoline CoCs were not detected at concentrations reported above the applicable cleanup criteria in the samples collected from the remaining on-site and off-site monitoring wells that were selected for sampling.

Based on the laboratory analytical results from the June 26 and 27, 2019, groundwater sampling event, EGLE unleaded gasoline CoCs were detected at concentrations reported above the applicable cleanup criteria in the groundwater samples collected from monitoring and observation wells MW-20, MW-22, MW-23, MW-24, MW-31, MW-39, and OW-F. EGLE unleaded gasoline CoCs were not detected at concentrations reported above the applicable cleanup criteria in the samples collected from the remaining on-site and off-site monitoring wells that were selected for sampling.

Based on the laboratory analytical results from the September 3 and 4, 2019, groundwater sampling event, EGLE unleaded gasoline CoCs were detected at concentrations reported above the applicable cleanup criteria in the groundwater samples collected from monitoring, recovery, and observation wells MW-08R, MW-20, MW-22, MW-23, MW-31, MW-37, MW-39, MW-40, RW-36, and OW-F. In addition, several laboratory detection limits for the groundwater sample collected from monitoring well MW-24 were above EGLE cleanup criteria. EGLE unleaded gasoline CoCs were not detected at concentrations reported above the applicable cleanup criteria in the samples collected from the remaining on-site and off-site monitoring wells that were selected for sampling.

Based on the laboratory analytical results from the December 5, 2019, groundwater sampling event, EGLE unleaded gasoline CoCs were detected at concentrations reported above the applicable cleanup criteria in the groundwater samples collected from monitoring and observation wells MW-22, MW-23, MW-24, MW-31, MW-39, and OW-F. EGLE unleaded gasoline CoCs were not detected at concentrations reported above the applicable cleanup criteria in the samples collected from the remaining on-site and off-site monitoring wells that were selected for sampling.

For the QA/QC samples, the laboratory analytical results of duplicate groundwater samples DUP1 and DUP2 collected on March 7 and 8, 2019, were similar to the analytical results of the groundwater samples collected from the corresponding wells MW-23 and MW-22, respectively.

The laboratory analytical results of duplicate groundwater samples DUP1 and DUP2 collected on June 26 and 27, 2019, were similar to the analytical results of the groundwater samples collected from the corresponding wells MW-24 and MW-39, respectively.

The laboratory analytical results of duplicate groundwater samples DUP1 and DUP2 collected on September 3 and 4, 2019, were similar to the analytical results of the groundwater samples collected from the corresponding wells MW-37 and MW-24, respectively.

The laboratory analytical results of duplicate groundwater samples DUPA and DUPB collected on December 5, 2019, were similar to the analytical results of the groundwater samples collected from the corresponding wells MW-09D and MW-39, respectively.

Analytical results will naturally vary between the sample and the duplicate due to field and laboratory practices, the volume of groundwater removed from the well prior to sample collection, and the use of multiple vials. The laboratory analytical results of the field blank and trip blank samples were below laboratory detection limits for all CoCs. The analytical results for the QA/QC samples are included in the laboratory-provided analytical reports presented in **Appendix C**.

4.0 PROPOSED FUTURE ACTIONS

On behalf of Speedway, the following actions will be conducted at the site:

- Conduct groundwater and soil gas sampling in 2020;
- Evaluate and sample select off-site storm sewer structures;
- Obtain off-site access for the installation of a soil gas monitoring point;
- Prepare and record on- and off-site Restrictive Covenants; and
- Evaluate the site for closure.

Inspection revealed that the Catox's VCV valve was not closing completely, but the PLC was recognizing that it was. Falmouth (manufacturer of the catox and VCV valve) said that they recommend sending the unit in for maintenance and upgrade. Other unique abnormalities were noticed as well. The PLC would freeze while logging into the program at times, and would be fine at others. The SVE VPD at times would read "under voltage", and then be fine at others. Power would be cycled, and all functions would then be normal. ATC checked VPD capacitors, relays, and voltages of various panel components and all tested fine. Despite the VCV not fully closing, it still operated perfectly fine. The system was restarted, and with no alarms or abnormalities, and was left on. The system was restarted, and with no alarms or abnormalities, and was left on. AWSHH float has been intermittently shutting the system down. The float was electrical contacts were disassembled, but could not physically remove the float from the AWS for fear that it would break. Connections in the wiring were traced and checked for faults. None were found. The alarm was cleared and the system was restarted and monitoring. The system was running properly during the monitoring and at departure. Inspection revealed that the Catox's VCV valve was not closing completely, but the PLC was recognizing that it was. Falmouth (manufacturer of the catox and VCV valve) said that they recommend sending the unit in for maintenance and upgrade. Other unique abnormalities were noticed as well. The PLC would freeze while logging into the program at times, and would be fine at others. The SVE panel bulb (normally reserved for RUN operation) was illuminated at all times. The SVE VFD at times would read "under voltage"; and then be fine at others. Power would be cycled, and all functions would then be normal. ATC checked VFD capacitors, relays, and voltages of various panel components and all tested fine. Despite the VCV not fully closing, it still operated perfectly fine. The system was restarted, and with no alarms or abnormalities, and was left on. Adam Wrubel AWSHH float has been intermittently shutting the system down. The float was electrical contacts were disassembled, but could not physically remove the float from the AWS for fear that it would break. Connections in the wiring were traced and checked for faults. 	psi After restart, while SVE/Catox was ramping up, ATC left momentarily to pick	
	up supplies at hardware store. At arrival from hardware store, LBWL,	
	Consumer's Energy, and Lansing Operations and Maintenance were onsite. A	
	monitor well j-plug had popped off from the sparge pressure, and was bubbling	
	over the well cover, onto asphalt and out to storm sewer. The store manager	
	was unsure of what it was and had called Consumer's Energy suspecting it was a	
	gas leak. ATC shut off sparge and bubbling stopped. Once ATC explained the	
	system, LBWL and Consumer's Energy left satisfied that there was no problem.	
O&M Activity	3/4/2019 ATC spoke with the City Sewer inspector and discussed if they needed any Adam W	/rubel

	7/30/2018 6/22/2018 6/21/2018 6/21/2018	check:

		remediation enclosure, trailer, and its components during the flooding of the	
		nearby Red Cedar River. The river had flooded to near record levels in the last	
		week of February. <hr/> The flood waters reached the remediation trailer and	
		had covered the floor approximately 6 inches above it. Components that may	
		have been affected by the flooding include: AWS transfer pump, Heat exchanger	
		blower, Catox combustion chamber, electrical power transformer, AS blower	
		muffler. Prior to the flooding, the power to the remediation trailer was	
		disconnected by the Lansing Board of Water and Light as a preventative	
		measure. Temperatures during the flooding were approximately 50-60 degrees	
		F. Since disconnection, temperatures have dropped, and now hover just above	
		freezing during the day, and in the low 20a??s at night. Without power, some	
		other components may be affected by the temperatures. A 200# water	
		treatment carbon vessel is installed inside the trailer and may have been	
		damaged due to the temperature drop. In the interim, before inspections of the	
		electrical components, a small space heater was placed above the floor to	
		prevent any further damage to components. Power was allowed to be used	
		from the facility store under permission of Shawn McFarlene (regional	
		environmental manager) via extension cord from an external outlet. Once the	
		remediation trailer has been warmed, a further assessment of the vessel can be	
		done for damages. The component at that point will be removed and stored.	
		done for damages. The component at that point will be removed and stored. Stored the system is restarted and operation of the system continues, a	
O&M Activity		thorough assessment of the transformer and the remediation system	Adam Wrubel
Odivi Activity		ATC was onsite to shut system down, and remove any equipment or materials	Addin Widdei
		that could be salvaged prior to flooding. ATC met LBWL onsite and oversaw the	
		"cutting" of incoming lines. After the "cutting", power is completely removed	
O&M Activity		from any equipment that may potentially see flooding.	Adam Wrubel

MAINTENANCE

sources of electric supply. Follow lock out / tag out safety procedures. should be performed by qualified personnel only. This equipment has multiple WARNING: Hazardous voltage can cause severe or fatal injury. Electrical work

1 WK AFTER INITIAL STARTUP / YEARLY

Catalyst level check

Level must be checked several times following replacement. Follow instructions in previous section for checking catalyst level and topping off.

EVERY 6 MONTHS VCV filter

(Solberg part #231P). The filter is washable with mild detergent. Rinse well. operated in dusty conditions more frequently. The filter has a replacement element Turn the unit off before inspecting the filter. Element should be checked if the unit is

EVERY 3 YEARS

The VCV should be returned to Falmouth Products every three years for cleaning,

inspection, and adjustment.

MEEKLY

Gauges

Obstructions on the vacuum or pressure sides of the blower result in high vacuum Check vacuum and pressure gauges frequently for unusual readings.

readings. and/or pressure readings. For example: a clogged blower filter will result in high vacuum

MONTHLY

Flame ArrestorInlet Pressure

Contact Falmouth Products for cleaning procedure. obstructed flame arrestor or excessive flow. Inspect flame arrestor for obstructions. Inlet pressure should be monitored monthly. High inlet pressure may indicate an

WINTER

Cold weather

knockout tank. The VCV has its own heater, and it is not necessary to insulate it. In cold climates heat tape and insulate all exposed inlet vapor lines and water

YJAA3Y

Electrical Ground bar and grounding connections

Ground bar and connections should be inspected and replaced if corroded or damaged.

Check grounds in the following locations:

- Circuit breaker box or service panel
- FALCO main electrical enclosure ground bars (two)
- Ground lugs (Heater conduit body, VCV conduit body, and pressure switch)
- Ancillary or optional equipment enclosure grounds (various)

YJAA3Y

Heater and Blower electrical connection (control panel)

All Line/Load electrical connections should be inspected and tightened.

Heater electrical connection (distribution block in heater conduit body) **EVERY 3 YEARS**

All electrical connections in heater conduit body should be inspected and tightened.

QUARTERLY

Pressure switch low pressure port

Note: port has a sintered metal filter inside it (this is normal). Verify that there is no other debris in port (Mud Dauber wasp nest). Clean out as required.

MEEKLY Water knockout

fill the water knockout unless some provision is made to shut down the system run water into the oxidizer. Site check intervals should not exceed the time it takes to should be shut down and water accumulations drained during every site visit. Do not Water knockouts can be purchased separately from Falmouth Products. The system

automatically (high level switch).
