RE: DTE Electric Company Response to the EGLE-AQD Violation Notices of February 11 and February 12 Issued to Monroe Power Plant

This letter is in response to the Violation Notices (VN) issued by EGLE-AQD on February 11 and February 12 to Monroe Power Plant related to particulate matter continuous emission monitor (CEM) downtime and failure to update the malfunction abatement plan (MAP). The VNs cited the following:

Process Description	Rule/Permit Condition Violated	Comments
EU-UNIT4, Coal-fired cell burner boiler	R 336.1910/EU-UNIT4 SCIV.1; FGMATS SCIV.1, SC VI.5	Malfunctioning mist eliminator trays and wash nozzles cause by pluggage in the flue gas desulfurization control device caused the unit's SO ₂ , NOx, CO, and CO ₂ CEMS to malfunction for 190 consecutive hours.
	EU-UNIT4 SC III.1	Failed to update malfunction abatement plan (MAP) 45 days after determining cause of FGD malfunction.
	EU-UNIT4, SC VI.3; FG-MATS, SC VI.5, SC VI.6, SC VI.9, SC VI.10	Fourth quarter 2020 SO ₂ , NOx, CO, CO ₂ monitor downtime was 9.9% of the operating time for the quarter.

DTE Electric's response provides its review of the situation and identifies actions taken and proposed to be taken to prevent recurrence. Emissions data using data substitution per 40 CFR Part 75, as applicable, is included as an attachment to this submittal as requested. This data shows that there were no emissions exceedances during the period in question. Further information on this determination is outlined below.

DTE Electric Company reported 190 hours of monitor downtime for each of the SO₂, NO_x, CO₂, and CO monitors on Unit 4 for the fourth quarter of 2020. This accounted for 9.9% monitor downtime for the operating quarter. The period in question started on November 25, 2020 and the monitors were returned to service on December 3, 2020.

The monitor downtime was caused by a plugged dilution sample probe filter. This pluggage in the monitor probe stemmed from particulate entering the probe and plugging the stone filter within the system. The flue gas desulfurization (FGD) system at the plant uses a limestone slurry which reacts with components of the stack gas to control emissions. That slurry contains particulate which can enter the monitoring system intake. Although this issue caused the pluggage of the dilution sample probe filter, it is important to note that FGD system continued to control emissions as designed.

On November 29, 2020 the referenced monitors failed daily calibrations. After initial efforts to bring the monitors back into calibration were unsuccessful, additional resources were brought into the plant to investigate the issue. This is when the plant instrument and control (I&C) technicians discovered the plugged probe filter. The filter was removed and cleaned and returned to the system. This was thought to have addressed the issue and the monitors were returned to service. The unit was operating in a “cycling” mode during this period and load was varying between low and high load operation. As the load on the unit increased after the filter was replaced, CO₂ monitor data at higher loads did not increase accordingly. Further investigation revealed that the probe had not been cleared of all pluggage. Emissions data at low loads did not indicate an issue, but the higher load operation had signalled that the issue persisted. After a full investigation, downtime back to November 25, 2020 was identified which hadn’t been evident due to lower load operation. Additional cleaning of the probe was completed through December 3, 2020 when the issue was completely resolved. The monitors were returned to normal operation and measures were put in place to ensure normal operation continued. Unit 4 began a periodic maintenance outage on February 21, 2021 and is expected to last through mid-May. Outage work includes maintenance to the mist elimination system and upgrading chevrons within the FGD system which will minimize particulate in the stack to the extent possible.

Mist eliminator inspections have been a part of the plant’s planned periodic and forced maintenance outage plans for several years. However, the plant has made changes to its ongoing maintenance procedures. In addition to the mist eliminator inspections performed during outages, the following will be performed during outages of sufficient duration:

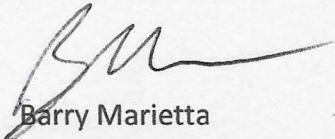

- Perform mist eliminator spray functional test for plugged/broken nozzles and headers
- Inspect and clean mist eliminator trays for plugging
- Inspect and clean base of stack and stack drains

The additional testing and inspections are expected to identify such issues going forward. The changes indicated above are being added to the plant’s MAP associated with the FGD

equipment (Monroe Power Plant Order EV-15). The updated MAP will be submitted to EGLE no later than March 19, 2021.

If you have any questions on the information in this letter or would like further information, please contact me at Barry.Marietta@dteenergy.com or (810) 343-6391.

Sincerely,

Barry Marietta
Manager – Environmental Strategy
DTE Energy
