

Waters Landfill

Fugitive Dust Control Plan

- I. Site Roadways/Operational Area
 - A. The dust on site roadways will be controlled by applications of water, or other acceptable dust control compound. Applications of dust suppressants will be done as often as necessary to minimize fugitive dust emissions.
 - B. All paved roadways will be swept as needed.
 - C. Any material spillage on roads will be cleaned up immediately.

- II. Storage Piles
 - A. Stockpiling of soils will be performed to minimize drop distance and control potential dust problems.
 - B. Stockpiles will be watered as needed to minimize fugitive dust emissions. Equipment to water or apply dust suppressant will be available at the site or on call for use at the site within a given operating day.

- III. Truck Traffic
 - A. Vehicles will be loaded to prevent their contents from dropping, leaking, blowing or otherwise escaping.

- IV. Other Sources
 - A. Other sources of fugitive dust may be special waste material approved as alternative daily cover (ADC). Most material received as ADC is utilized on a daily basis. However, if the material were stockpiled for future use, fugitive dust emissions would be controlled from the pile by watering or covering the material with a geotextile.

- V. EGLE – AQD Inspection
 - A. The procedures of this plan are subject to modification if following an inspection and written notification from the AQD finds the fugitive dust requirements are not being met.
