

**DEPARTMENT OF ENVIRONMENTAL QUALITY  
AIR QUALITY DIVISION  
ACTIVITY REPORT: Scheduled Inspection**

N676526016

<b>FACILITY:</b> Aleris Specification Alloys, Inc.	<b>SRN / ID:</b> N6765
<b>LOCATION:</b> 2600 Nodular Drive, SAGINAW	<b>DISTRICT:</b> Saginaw Bay
<b>CITY:</b> SAGINAW	<b>COUNTY:</b> SAGINAW
<b>CONTACT:</b> Brady Myers , Regional Health, Safety & Environmental Manager	<b>ACTIVITY DATE:</b> 07/18/2014
<b>STAFF:</b> Kathy Brewer	<b>SOURCE CLASS:</b> SM OPT OUT
<b>SUBJECT:</b> Facility idled on Dec. 23, 2013 except for screening operations.	
<b>RESOLVED COMPLAINTS:</b>	

I (KLB) conducted a scheduled inspection at Aleris Saginaw facility. Mr. Brad Myers, Regional H, S & E Manager, & Ms. Kelly Streeter, Facility Administrator, participated in the inspection. The facility is an aluminum processing operation that supplied molten aluminum to the General Motors Powertrain Plant located approximately two miles from Aleris. All but a screening/shaker operation has been idle since December 23, 2013.

The facility is categorized as an area source with all processes covered under opt out permit No. 58-07B issued on April 3, 2008. The facility is subject to the area source requirements of 40 CFR 63 Subpart RRR, Secondary Aluminum Production NESHAP. The three reverberatory furnaces are currently the only affected sources under the NESHAP. In 2009 the facility reached agreement with EPA on violations cited in a Consent Decree that required improvements to emission capture. The Consent Decree was terminated on May 17, 2011.

The primary sources of air emissions are a rotary hammer crusher, three (3) reverberatory aluminum melting furnaces, crucible stations and dross handling. The facility was designed & operated to melt clean sows/ingots along with returns from GM in the three reverberatory furnaces. The molten aluminum was brought to spec and tapped into transport crucibles that carried the molten aluminum to GM via semi tractor-trailer.

The facility previously had over 30 employees and operated up to (3) 8-hour shifts. Aleris is maintaining the facility in a condition that would allow operations to occur with minimal start up required.

**EUCRSR – 50,000 lb. /hr. Rotary Hammer Crusher: Compliant**

A hammer mill unit used to break aluminum returns from GM down to a size more suitable for charging to a furnace. The crusher is controlled by a 60,000 cfm baghouse with bag leak detection. The emission unit was not operating at the time of the inspection. The control equipment is still onsite.

EUCRSR restricts the emission of PM, PM-10, VOC and opacity. Stack testing was conducted in September 2007 which documented an exceedance of the PM-10 limit. A violation notice was issued and the facility subsequently requested and received a permit modification for a higher PM-10 limit. Continued Compliance with the PM emission limits is demonstrated through control equipment monitoring to demonstrate proper operation.

Material throughput is limited to 56,000 tons per year based on a 12 month rolling average. Records reviewed showed that 11,884.8 tons had been charged during 2013, with a 12 month rolling average of 4,93 as of December 2013.

**EUDROSS – Dross Handling and Load out**

Handling and load out of dross generated by the reverberatory furnaces. Controlled by 60,000 CFM. The 12 month rolling average for 2013 was 11,885 tons of charge.

EUDROSS restricts the emission of PM and PM-10. Compliance with the emission limits is demonstrated through proper operation of the required baghouse control equipped with a bag leak detection system.

12 mo rolling avg's for flux use and dross from each furnace are attached. The facility will provide baghouse operating and maintenance records at a later date.

The screening/shaker unit was operating during the inspection to process castings from GM SMCO. The emissions vent to same baghouse as EUDROSS – stack vent ID SV003. No opacity was observed emitting from the baghouse. The screened material is sent to an Aleris facility in Coldwater, MI.

#### EUFURN1 & EUFURN2, EUFURN3, FLUE 1, FLUE 2, and FLUE 3

Emission units associated with the three furnaces and combustion flues for each furnace. Emissions associated with the furnace sidewalls have lime-injected baghouse control. Emissions from the flues vent uncontrolled.

Reported emission for HF, HCl, Cl, PM-10, and VOC for EUFURN1 & EUFURN2 (combined), EUFURN3, Flue 1, Flue 2 and Flue 3 were below permitted limits. See the attached emission calculations, PTI tables, and MAERS report for details.

The last stack testing was conducted in September 2007 which documented an exceedance of the PM-10 limit for Flue 1. A violation notice was issued and the facility subsequently requested and received a permit modification for a higher PM-10 limit.

Compliance is demonstrated through previous stack testing as well as proper operation of the lime injected baghouses per the EPA Consent Decree enhanced capture plan.

The facility will provide baghouse operating and maintenance records at a later date.

#### FG001 – (EUFURN1 & EUFURN2, EUFURN3)

Flex group includes the emission units associated with charging, melting and fluxing of the three furnaces. The furnaces were not operating during the inspection.

Emission limits for dioxin/furan in accordance with Subpart RRR are included in the PTI. Stack testing in 2007 demonstrated compliance with the d/f limit.

FG001 limits charge to the three furnaces to a maximum amount of 285,400 tons per 12-month rolling time period. Records reviewed showed that 60,256 tons have been charged from June 2012 – June 2013.

The process is required to have baghouse control equipped with bag leak detection. We viewed the baghouse serving furnace #3. The baghouse has damper for heat control and equipment for lime addition.

In August 2012 the facility submitted a revised Operation, Maintenance & Monitoring (OMM) plan to include a new lime feeder setting for the baghouses that control furnace exhaust. The facility will provide baghouse operating and maintenance records at a

later date.

Monthly charge rates for 2010 -2014 are attached. Daily charge rates for March 13 -18, 2013 are also attached.

#### FG002 – (EUHEAT1- HEAT21)

Flex group includes the 18 crucible stations where the molten aluminum is poured into transport crucibles. Emissions from the crucible stations are ducted to a baghouse that also controls emissions from the 9 crucible pre-heat stations and crucible cleaning. The crucibles were not operating during the inspection.

FG002 restricts the emission of PM-10 to 0.22 lb/hr and VOC to 0.33 lb/hr. Compliance with the PM-10 emission limits is demonstrated through proper operation of the required baghouse control equipped with a bag leak detection system. The facility will provide baghouse operating and maintenance records at a later date.

#### FGFACILITY

Flex group that establishes facility-wide opt out limits and incorporates Subpart RRR requirements.

Emission limits for CO, NOx and PM-10 are 66.12 TPY, 40.01 TPY, and 89.97 TPY. Reported 2013 tons of emissions were 9.67 for CO, 11.5 for NOx, and 32.8 for all PM.. The PM-10 limit is an opt-out for Title V.

Compliance with CO and NOx emissions is determined based upon fuel usage for FGFACILITY. Compliance with PM-10 emissions is determined based upon stack testing for FG001, EUCRSR and Flue 1, 2, and 3. PM-10 emissions from FG002 are based upon fuel usage.

The baghouses for the furnace and crucible emissions remain on site and appear to be installed properly and capable of operating in compliance with air requirements. Furnace baghouses employ lime injection for dioxin/furan control required under the NESHAP. All baghouses are equipped with broken bag detectors and are able to be continually monitored through redundant process control systems and recorded on strip charts on a per shift basis. The baghouse monitoring system is set up to log alarms and record corrective action. An automated preventative maintenance schedule is established for the baghouses.

Please see attached supporting records and calculations for details.

#### 40 CFR PART 63 SUBPART RRR

The facility is subject to Subpart RRR as an area source, with the affected emission units being the three aluminum reverberatory furnaces. As an area source the furnaces are subject to the dioxin/furan limits for a Group 1 furnace as well as the associated monitoring requirements. The facility tested and demonstrated compliance with the D/F limit in September 2007.

Baghouses are the controls used at this facility. Furnace baghouses employ lime injection for dioxin/furan control under the NESHAP. All baghouses are equipped with broken bag detectors, monitored through redundant process control systems and recorded on strip charts. Baghouse alarms and corrective action are recorded. The site has an automated PM schedule for the baghouses.

Based upon the information and observations made during this inspection, the facility is in compliance with applicable air quality rules and regulations, including permit to install No. 58-07B and Subpart RRR, the Secondary Aluminum Production NESHAP.

5.53  
 ALL PM

**The following conditions apply to: FG001**

**Emission Limits**

Pollutant	Equipment	Limit	Time Period	Testing/Monitoring Method	Applicable Requirement
Dioxins and Furan (D/F)	FG001	0.00021 grain of D/F TEQ* per ton of charge	Test Protocol	GC 13	40 CFR Part 63, Subpart RRR

\* TEQ means the international method of expressing toxicity equivalents for D/F as defined in "Interim Procedures for Estimating Risks Associated with Exposures to Mixtures of Chlorinated Dibenzo-p-Dioxins and -Dibenzofurans (CDDs and CDFs) and 1989 Update" (EPA-625/3-89-016).

**Material Usage Limits**

- 4.2 The permittee shall not charge more than 285,400 tons per year of feed or charge to the FG001, based on 12-month rolling time period, as determined at the end of each calendar month. (R 336.1205(3))

**Process/Operational Limits**

- 4.3 The permittee shall not operate the FG001 unless its associated baghouses are installed and operating properly. In addition, the bag leak systems shall be monitored and maintained according to their manufacturer's specifications. (R 336.1910)

**Recordkeeping/Reporting/Notification**

- 4.4 The permittee shall keep record of the feed/charge to the FG001. Such records shall be kept on file for a period of at least five years and made available to the AQD upon request. (R 336.1205(3))

#### Stack/Vent Restrictions

	Stack & Vent ID	Maximum Diameter (feet)	Minimum Height Above Ground Level (feet)	Applicable Requirement
4.5a	SV002	5.67	75	R 3336.12803, R 336.12804, 40 CFR 52.21 (c) and (d)
4.5b	SV005	3.83	60	R 3336.12803, R 336.12804, 40 CFR 52.21 (c) and (d)
The exhaust gases shall be discharged unobstructed vertically upwards to the ambient air.				

The following conditions apply to: FG002

#### Emission Limits

	Pollutant	Equipment	Limit	Time Period	Testing / Monitoring Method	Applicable Requirement
5.1a	PM-10	FG002	0.22 lb/hr	Test Protocol	GC 13, SC 7.4, SC 7.10	R 336.1205(3)
5.1b	VOC	FG002	0.33 lb/hr	Test Protocol	GC 13	R 336.1205(3)

#### Process/Operational Limits

- 5.2 The permittee shall not operate the FG002 unless its associated baghouse is installed and operating properly. In addition, the bag leak detection system shall be monitored and maintained according to its manufacturer's specifications. (R 336.1910)

#### Stack/Vent Restrictions

	Stack & Vent ID	Maximum Diameter (feet)	Minimum Height Above Ground Level (feet)	Applicable Requirement
5.3	SV004	5.0	75	R 3336.12803, R 336.12804, 40 CFR 52.21 (c) and (d)
The exhaust gases shall be discharged unobstructed vertically upwards to the ambient air.				

The following conditions apply to: FGFACILITY

2013  
MAERS

Pollutant	Equipment	Limit v. 2013	Time Period	Testing/ Monitoring Method	Applicable Requirement
6.1a CO	FGFACILITY	66.12 tpy <i>9.67</i>	12-month rolling time period as determined at the end of each calendar month	SC 6.9 and Appendix A	R 336.1205(3)
6.1b NO <sub>x</sub>	FGFACILITY	44.01 tpy <i>11.5</i>	12-month rolling time period as determined at the end of each calendar month	SC 6.9 and Appendix A	R 336.1205(3)
6.1c PM-10	FGFACILITY	89.97 tpy <i>32.8</i>	12-month rolling time period as determined at the end of each calendar month	SC 6.4, SC 6.10	R336.1205(3)

**Process/Operational Limits**

- 6.2 The permittee shall not operate the process or process equipment covered by this permit unless the malfunction abatement plan approved by the AQD District Supervisor has been implemented and is maintained. (R 336.1911)
- 6.3 Applicant shall not operate the process or process equipment covered by this permit unless the Operation, Maintenance & Monitoring plan as specified in 40 CFR Part 63, Subpart RRR, Sections 63.1506 and 63.1510 approved by the AQD District Supervisor has been implemented and maintained. (40 CFR Part 63, Subpart RRR)

**Testing**

- 6.4 Within 90 days after the issuance date of this permit, the permittee shall verify and quantify PM-10 emission rates from FGFACILITY by testing at owner's expense, in accordance with Department requirements. No less than 60 days prior to testing, the permittee shall submit a complete test plan to the AQD. The AQD must approve the final plan prior to testing. Verification of emission rates includes the submittal of a complete report of the test results to the AQD within 60 days following the last date of the test. (R 336.1205, R 336.1220, R 336.1224, R 336.1225, R 336.1299, R 336.1702, R 336.2001, R 336.2003, R 336.2004, R 336.2802, 40 CFR 52.21)

**Monitoring**

- 6.5 The permittee shall install, calibrate, maintain and operate in a satisfactory manner a device to monitor and record the natural gas usage for equipment included in FGFACILITY on a continuous basis. (R 336.1205(3))
- 6.6 Monitoring and recording of emissions and operating information is required to comply with the Federal National Emission Standards for Hazardous Air Pollutants (NESHAP) specified in 40 CFR Part 63, Subpart RRR. All source emissions data and operating data shall be kept on file for a period of at least five years and made available to the AQD upon request. (40 CFR Part 63, Subpart RRR)

### Recordkeeping/Reporting/Notification

- 6.7 For records specified in this permit that are not required by 40 CFR Part 63, Subpart RRR, the permittee shall complete all required calculations in a format acceptable to the AQD District Supervisor and make them available by the last day of the calendar month, for the previous calendar month, unless otherwise specified in any recordkeeping, reporting or notification special condition. For records required by 40 CFR Part 63, Subpart RRR, the permittee shall complete all required calculations as specified in the Operation, Maintenance & Monitoring Plan (R 336.1205(3), 40 CFR Part 63, Subpart RRR)
- 6.8 The permittee shall keep, in a satisfactory manner, monthly fuel use records for equipment included in FGFACILITY, as required by SC 6.5. The permittee shall keep all records on file at a location approved by the AQD District Supervisor for a period of at least five years and make them available to the Department upon request. (R 336.1205(3))
- 6.9 The permittee shall keep, in a satisfactory manner, monthly and 12-month rolling time period CO and NOx emission calculation records for all equipment included in FGFACILITY, as required by SC 6.1a, 6.1b and Appendix A. The permittee shall keep all records on file at a location approved by the AQD District Supervisor for a period of at least five years and make them available to the Department upon request. (R 336.1205(3))
- 6.10 The permittee shall keep, in a satisfactory manner, monthly and 12-month rolling time period PM-10 emission calculation records for all equipment included in FGFACILITY, as required by SC 6.1c, 6.4 and Appendix A. The permittee shall keep all records on file at a location approved by the AQD District Supervisor for a period of at least five years and make them available to the Department upon request. (R 336.1205(3))
