| FACILITY: Quantum Composites  | inc.                          | SRN / ID: N6874           |
| LOCATION: 1310 South Valley C | enter Drive, BAY CITY         | DISTRICT: Saginaw Bay     |
| CITY: BAY CITY                |                               | COUNTY: BAY               |
| CONTACT: Dennis Mehl, Directo | r of Manufacturing            | ACTIVITY DATE: 03/06/2014 |
| STAFF: Kathy Brewer           | COMPLIANCE STATUS: Compliance | SOURCE CLASS: MAJOR       |
| SUBJECT:                      |                               |                           |
| RESOLVED COMPLAINTS:          |                               |                           |

I (KLB) conducted an announced inspection of the Quantum Composites, Inc., in Bay City, MI. Mr. Dennis Mehl, Director of Manufacturing, and Mr. Duane Gohr, Shift Supervisor, accompanied me during my site visit. The facility was issued ROP # MI-ROP-N6874-2011 to limit VOC and HAP emissions. The facility is subject to 40 CFR Part 63, Subpart WWWW, Reinforced Plastic Composites Production. No violations of air quality regulations were found during the inspection.

The facility is a sheet molding compound (SMC) and bulk molding compound (BMC) manufacturing facility. Resinous paste, filers, and product enhancers are mixed in batches in one of seven mixers that range in size from five gallons to 300 gallons. The emissions from the mixers are controlled by a VTI dust collector which then vents to the energy recovery unit. The paste mixture is transferred to one of the three molding compound machines. Fiberglass or carbon fiber may be added to the paste mixture for reinforcement and the paste mixture is spread between layers of carrier film. Heat and chilling may be used to control reaction rates. The product is packaged and shipped or placed in a cooler. Production equipment is cleaned with solvents. The used solvents are temporarily stored on site until disposed. There are also quality assurance and product development testing laboratories.

All in plant air is vented to the VTI dust collector which is then vented to the 2.8 MMBTU energy recovery unit.

#### EGSMCBMC (EUSMCI, EUSMCII, EUSMCIII, EUMIXERS, EUBMCMIXER, EUSOLVENT, EUPRESS): Compliant

All three sheet molding compound processes are similar.

We viewed the resin storage and weigh station associated with mixing activities including the mateic acid mixing booth with emission collector. Mr. Gohr showed me the floor run records for resin batch sheets and SMC Formulation, and Mix Logs that each operator completes. The facility is currently operating between one and two shifts. The floor run records are used for production records and environmental reporting by updating the facility's record keeping system "MRP", for material usage including maleic anhydride and polystyrene. I also viewed the January 2014 floor records for shipping.

The EUSMCI process starts with the application of a bottom layer of resin mixture. Carbon fiber or fiberglass fibers are added on top of the resin. A film is rolled on top of the resin/fiber material. The mixture begins to cure as it travels along a conveyor. EUSMCI has the ability to heat the sheet molding compound with emissions exhausted to SV-14. The curing sheet of material can then be chilled to curtail the speed of the curing. All emissions after the heated portion of the process are vented to the in plant air which is then vented to the energy recovery unit.

The facility verifies the organic content of the raw products on a regular basis. The mixed formulations are specific to each customer's needs and must be accurate to obtain desired characteristics. The production material use values for air pollution records assume 100% of the material purchased is used in production.

Product Shop Hours are recorded by each employee. We reviewed the January 2014 Shop Hour sheets. A blank copy of an Operator activity record and a partially completed Formulation & Mix Log are attached. Each employee records the amount of time spent on a run including cleanup time when solvents are used. The Formulation & Mix Log record is for a run on EUSMCII. I viewed the original log. The ingredient list is blanked out on the attachment.

The facility has emission limits of 37.2 tpy VOC and pound per hour limits for styrene, methanol, and PM10. The site has pounds per hour processing rate limits or 64,600,000, 180,000, and 1,000,000 for EUMIXERS, EUBMCMIXER, and EUPRESS respectively. The production information from the Formulation & Mix Log and the employee time record is used to generate a site compliance report with hours of operation and pounds of each formulation used by process equipment/emission unit.

I reviewed the hourly styrene emission rate records for January 2013. The emission rate ranges from 0.444 pounds/hour to 1,346 pounds /hour. The January 2 - 5, 2013 operation and emission records are attached. On January 2, 2013 the site used 9,720 pounds of mixture, emitted 10.38 pounds of styrene, and operated a total of 9 hours. On site electronic records showed compliance with the process rate limits and hours/year operating limits for each SMC. A summary of 2013 process rates and operating hours is attached.

Short term solvents usage is determined by a measuring stick correlated to the containers volume. The liquid height is recorded by floor workers, converted to volume used, and recorded. A copy of the solvent use record for January 2014 is attached. Annual solvent usage is based on amount of solvent used minus amount of solvent sent for disposal. We reviewed electronic records for solvent usage, disposal & emission calculations.

EUSMCI has a Torit dust collector used to control particulate matter from fiber chopping. The Torit dust collector is vented to the in plant air. The Torit dust collector is used to collect dust from carbon fiber cutting operations. EUSMCI was producing a fiberglass containing

### **MACES-** Activity Report

composite without carbon fiber added so the Torit was not in operation. There is no pressure gauge on the Torit. I was told the Torit cartridges are cleaned periodically and replaced as needed. This is usually just a few times each year based on a visual inspection.

The VTI has an automated pulse jet cleaning cycle. I observed a pulse sound from the VTI during the inspection. The differential pressure gauge has an indicated proper operating range of 0.1 to 1 inches Hg. At the time of the inspection the pressure gauge read 0.01 inches Hg. Mr. Mehl stated that the bags had been changed 2 weeks prior.

We viewed some permit exempt emission units in the product development laboratory. We also viewed the bulk storage area and refrigerated product storage,

We viewed electronic emission records including calculations for 12 month rolling averages for HAPs and VOCs. The facility maintains a separate database to provide year to date information.

The 2013 emission totals are available by emission unit, pollutant, pounds/day, and hours. The production records contain the specific compounding information. The facility's ROP contains site specific calculations in Appendix 7 for emissions from FGSMCBMC.

Records of 12 month rolling totals for VOCs and HAPs are attached. During 2013, the facility had 5,406 pounds of VOC emissions from mixing and molding compound processes and 3,019 pounds of VOCs and HAPs were emitted from solvent usage. A summary of the emissions is attached.

### FGMACT (EUSMCI, EUSMCII, EUSMCIII, EUMIXERS, EUBMCMIXER, EUSOLVENT, EUPRESS): Compliant

The facility has potential emissions for styrene of over 22 ton per year and for methanol over 10 ton per year. The flexible group has a 12 month rolling limit of less than 100 tons per year of HAPs. We viewed the electronic records for FGSMCBMC. Total emissions in pounds for January – December 2013 are listed below.

| Pollutant                     | 12 month emissions VOC In pounds | 12 month emission HAPs in<br>pounds |
|-------------------------------|----------------------------------|-------------------------------------|
| Formaldehyde                  | 0                                | 0                                   |
| Maleic Anhydride              | 10                               | 10                                  |
| Methanol                      | 3918                             | 3918                                |

| Acetone (solvent usage)       | 0                                | (n/a)                               |
| Ethyl Acetate (solvent usage) | 3019                             | (n/a)                               |
| Total                         | 8425                             | 5406                                |

A summary of VOC and HAP emissions by emission unit and flexible group is attached.

The facility provided Notification of MACT WWWW Applicability on May 17, 2011. The facility is subject to the work practice standards in Table 4 of 40 CFR, Part 63, Subpart WWWW (attached). The site maintains records of the chemical composition of each material used. The facility uses acetone and ethyl acetate for cleanup – both non-HAP solvents. The mixers and SMC manufacturing machines had covers and delivery systems that appeared to be compliant with the required work practices at the time of the inspection.
